

Lumiblade OLED Panel Brite 2 FL300 nw

Neutral white – 4000K

Second time truly functional OLED-light

When it comes to lighting OLEDs inspire on a whole different level. There is the unique quality of the light itself. In combination with other characteristics e.g. the razor-thin shape and the instant glare-free light when switched on, OLEDs can be used to realize innovative applications and designs.

With its second generation of the OLED Panel Brite FL300 OLEDWorks brings OLED lighting again further into functional lighting applications, by featuring a more efficient and more beautiful OLED lighting experience.

With the luminous flux of up to 250 lumens the FL300 nw is the brightest OLED panel in neutral white commercially available worldwide.

The Brite 2 FL300 nw is available at two integration levels making it the ideal building block for every OLED lighting application to be used in the area of functional lighting.

Product features

- Efficacy of more than 50 lm/W
- CRI of >90 and a R9 >70
- Neutral white color temperature - 4,000K
- Low thickness of 1.4 to 2.1 mm

Benefits

- Brightest neutral white OLED panel commercially available with up to 250 lumens.
- Thin Film Encapsulation for ultimate reliability.
- Available at two different integration levels.
- Ideal for applications in general lighting systems.
- All the known advantages of OLED technology: – thin – homogenous – instant glare free

Applications

Every OLED light-application that is commercially viable and easy to implement. Special light-application for interior spaces that require beautiful and high performance lighting

Description

The OLED Panel Brite 2 FL300 nw is a flat light source. Focusing on general lighting applications, OLEDWorks OLED Lighting is developing products with a high lumen output at low costs. One significant step in this direction is the range extension of the OLEDWorks OLED Panel Brite 2 FL300 nw which are available at two different integration levels.

Introduction

OLED is a large-area diffuse light source. Unlike incandescent bulbs, which generate light by passing electricity through a wire, or fluorescent lamps, which pass current through a gas, OLED lighting works by passing electricity through one or more extremely thin layers of organic semiconductor material. These layers are sandwiched between one positively and one negatively charged electrode. The 'sandwich' is placed on a sheet of glass or other transparent material known as the substrate. The OLED is protected by a thin-film encapsulation and a flat heat spreader on the rear side. When current is applied to the electrodes, they inject positively and negatively charged holes and electrons. These recombine in the organic layer of the sandwich and create a brief, high-energy state called 'exciton'. As this layer returns to its original stable, non-excited state, the energy flows evenly through the organic film causing it to emit light.

In contrast to virtually all previous OLED products the OLED Panel family Brite FL300 is a product that for the first time attains the status of a general lighting application. As part of its ongoing product improvement, OLEDWorks will continue to develop the OLED Panel family Brite FL300 to higher levels of performance in different shapes and sizes, like now with the Brite 2 range extension.

This document refers to

Product	Integration Level	Product Code
OLED Panel Brite 2 FL300 nw N w/o Rset Level 1	1	LPB2300SINWLI01
OLED Panel Brite 2 FL300 nw A0 Level 2	2	LPB2300SINWL201

Standard compliance and sustainability

OLEDWorks products are environmentally friendly and provide efficient illumination without the use of hazardous materials.

This product is RoHS (EU Directive 2011/65/EU) and IEC 62868 compliant.

This product is compliant with UL8752. This product is UL recognized in file E353273.

Within the UL report certain 'Conditions of Acceptability' are mentioned as follows. When installed in the end product, the following shall be taken into consideration:

1. These products have been evaluated for connection to an isolated DC Class 2 constant current power source.
2. This product has been evaluated for use in dry or damp locations.
3. The OLED panel temperature shall not exceed 80 °C.
4. Input leads to the OLEDs are intended for factory installation only. Strain relief to be considered in the end-use application if leads are subjected to mechanical stress.
5. Input leads to the OLED panels shall be sufficiently separated from higher voltage conductors in the end-product in compliance with end-product requirements.

System

	Description	Remark
Indoor / outdoor	Indoor buildings	location with insignificant shock and vibration
Ingress protection		not applicable for OLED components
Classification	Applicable in applications with Class III (IEC) and Class II (UL) protection	Application standard IEC61140
OLED color	White	
Carrier material	Glass	
Cable	AWG 26	Brite 2 FL300 nw A0 Level 2
Connector	5-pin Molex Picoblade	
RoHS conform	Yes	2011/65/EU

Operational environmental conditions*

Specification item	Value	Unit	Condition
Ambient temperature	+5 ... +40	°C	
Relative humidity	20 ... 80	%rH	no dew, no water spray, a maximum %rH of 60 is recommended.
Recommended internal operation temperature (temperature of OLED emission side)	≤ 40	°C	local temperature
Maximum internal operation temperature (temperature of OLED emission side)	≤ 80	°C	local temperature, for T > 40 °C lifetime will be reduced.

* please refer to Thermal Characteristics on page 20 for more information.

The Brite 2 FL300 nw is designed for indoor use only. Do not expose to water or excessive moisture.

Storage conditions*¹

Specification item	Value	Unit	Condition
Ambient temperature	-40 ... +60	°C	
Relative humidity	5 ... 85	%rH	no dew, no water spray

*¹ Recommended storage temperature is between 15 ... 25 °C with a humidity < 65 %rH.

Transport conditions

Specification item	Value	Unit	Condition
Ambient temperature	-40 ... +60	°C	
Relative humidity	5 ... 85	%rH	no dew, no water spray

Mechanical handling

OLEDs are electronic components and should not be tampered with in any way. They are made of thin glass with potentially sharp edges. Avoid mechanical stress, such as shock, pressure, bending, torsion and especially point loads on the OLED. To avoid fingerprints on the front side, preferably handle the OLED from the sides. Gloves or finger cots are recommended at all times whilst handling the OLED.

Avoid contact with water. Do not submerge OLEDs in any kind of solvent, acid, base, salt or other chemicals.

In case of damage to the product, disconnect the product from power supply without touching the damaged parts. Do not reconnect the product. Contact the manufacturer or a qualified service technician.

Improper use can cause OLEDs to break resulting in glass splinters. Please handle all OLEDs with care to avoid breakage as especially the edges of the OLED are very delicate. Use of protective gloves is advised, in particular with broken OLEDs or OLEDs with sharp edges/corners. Avoid direct contact with broken OLEDs.

The product may become warm during normal use. Do not cover with materials that are flammable.

ELECTRICAL AND OPTICAL CHARACTERISTICS - OLED

Electrical characteristics

Specification item	Value	Unit	Condition
OLED rated current, $I_{in \text{ rated}}$	0.260	A	
OLED voltage at $t=0$, U_{in}	20.8 +/- 1.0	V DC	$I_{in \text{ rated}}$
OLED voltage at end of life, $U_{EOL} = U_{in \text{ max}}$	25.5	V DC	$I_{in \text{ rated}}$
Power consumption at $t=0$, P_{in}	5.4	W	$I_{in \text{ rated}}$
Power consumption at end of life, $P_{EOL} = P_{in \text{ max}}$	6.6	W	$I_{in \text{ rated}}$

All data nominal at stabilized conditions after 5 min warm-up, $T_{\text{organic}} = 40^\circ\text{C}$.

OLED drivers

Use of power supplies with dedicated controls for turning off output power if an OLED fails is recommended when operating the OLED Panel Brite 2 FL300 nw. Examples of recommended drivers are shown in the table below. These drivers all have sockets compatible with the Molex Picoblade connector.

Product	Supply voltage	Output channels	Philips Product Code
Driver D230V 80W/0.1-0.5/1A/28V TD/A 8CH ¹	120, 220-240, 277 V AC	8	9254.000.10200
Driver D024V 10W/0.1A-0.4A/28V D/A	24 V DC	1	9254.000.10100
Driver D024V 10W/0.1A-0.4A/28V DMX	24 V DC	1	9254.000.12000

Dimming

Both pulse width modulation (PWM) and amplitude modulation (AM) techniques can be used to dim the OLED. More detailed information can be found in the design-in guide for the Brite FL300 family.

OLED connection

The OLED Panel Brite 2 FL300 is available at different integration levels. At integration level 1, no cable is attached to the device. Integration levels 2 provide a cable with a Molex Picoblade connector type compatible with the Lumiblade OLED drivers and resistors integrated in the cable which support the recognition of the correct panel settings by the drivers.

At integration level 1 the Brite 2 FL300 features contact areas on the rear side (see Figure 7). Area A and D provides contact pads A1 or D1 (plus) and A2 or D2 (minus). The individual signals for the 5-wire connector are shown in Figure 8. Only one of the interface areas need to be used for electrical contact.

¹ Note: this product won't be available in the European Union after September 2016

Figure 7: Contact pads of the Brite 2 FL300 nw N w/o Rset Level 1

The function of the connector is illustrated in Figure 8. A1 and D1 link to the plus pole and A2 and D2 link to the minus pole. Using the Molex connector of the integration level 2 according to the schematic in Figure 8 the dedicated OLED drivers automatically recognize the panel and drive it correctly.

Figure 8: Channel connections from driver to the Brite 2 FL300 nw A0 Level 2

Specification item	Value	Unit	Remark
Wire cross-section	26	AWG	flat cable; voltage rating: 300 V; circuits: 5
Wire length	198 ± 5	mm	
Connector (header/crimp)			Molex Picoblade male

OLED voltage

The voltage of the OLED depends on the point of operation, temperature of the organics and the age of the OLED. As a result, the OLED voltage is affected by the ambient temperature. During operation the temperature of the organics may increase, especially shortly after powering the OLED. At constant current control, this may result in a change in voltage.

Example of voltage evolution after a cold start at different ambient temperature levels is shown in Figure 9. The initial voltage drop is due to the device heating up until steady state (approx. 5 min after turning on). Besides this the voltage/organic temperature depends on the ambient temperature.

Figure 9: typical voltage evolution after start-up at different ambient temperatures, integration level I, vertical orientation, air, $I_{in rated} = 0.260 A$

Figure 10 shows typical decrease of the driving voltage of the Brite 2 FL300 after a cold start until steady state conditions when operated at different ambient temperature conditions ranging from 5 °C to 40 °C. In this example the device is driven at rated current. Electrical steady state conditions are typically reached after 5 min of operation at rated current. Typical drop down voltage after turn on at room temperature (RT = 25 °C) and rated current is 0.6 (integration level I vertically oriented in air at rated current).

Figure 10: Voltage differences between turning device on and after 10 min at different ambient temperatures T_a , integration level I, vertical orientation, air, $I_{in rated} = 0.260$ A

Figure 11 gives the voltage offset that results from varying the ambient temperature T_a with respect to $RT = 25^\circ\text{C}$. Two curves are given, one for steady state condition (blue) and one for the turn on condition (orange).

Figure 11: impact of ambient temperature T_a on change of OLED voltage with respect to $RT = 25^\circ\text{C}$, Integration level I, vertical orientation, air, $I_{in rated} = 0.260$ A

Short circuit behavior

If an OLED fails it can fall into a short circuit. Such a condition may mean that

- no light is generated
- the OLED is heated locally, i.e. one small spot of the OLED surface gets hot
- the current still flows through the OLED but the voltage drops to a lower value.

In case such a fault occurs turning off the OLED is recommended.

Optical characteristics FL300 nw*²

Specification item	Value	Unit	Condition
Luminance, nominal	7100	cd/m ²	@ I _{in rated} = 0.260 A, perpendicular, center
	3000		@ 0.106 A, perpendicular, center

OLED spectrum

Typical spectra of the OLED at different driving currents are given in Figure 12.

Figure 13: typical emission spectra of the Brite 2 FL300 nw at different driving currents ($I = 0.106$ A, 0.200 A, 0.260 A)

Current – voltage – luminance characteristics

Figure 14: Luminance versus forward current at room temperature, integration level 1

Figure 15: Voltage versus forward current at room temperature, integration level I

Figure 16: Luminous flux vs current, integration level I

Figure 17: Efficacy versus current at room temperature, integration level 1

Homogeneity of optical parameters

The OLED Panel Brite 2 FL300 is a large area device and the luminance value may depend on the location within the active area. A very small color point distribution may also be observed: Typical values for a bare OLED at rated current and room temperature are $\Delta CIE_x \approx 0.0012$, $\Delta CIE_y \approx 0.0015$ ($\Delta CIE_u' \approx 0.0013$, $\Delta CIE_v' \approx 0.0004$).

Figure 18: Typical luminance distribution for a Brite 2 FL300 nw N w/o Rset Level 1. Operation conditions: vertical in air, RT (= 25 °C), $I = I_{in rated}$

Angular dependency

The luminance (measured in cd/m^2) of the OLED light depends on angle of observation. Figure 19 shows typical values for the OLED Panel Brite 2 FL300 nw N w/o Rset Level 1 operated at different driving currents.

Figure 19: Luminance as function of the viewing angle. Driving currents $I = 0.106 \text{ A}$, 0.200 A , 0.260 A

Figure 20: CIE x/y as function of the viewing angle. Driving currents $I = 0.106$ A, 0.200 A, 0.260 A, integration level I

Figure 21: CIE u'/v' as function of the viewing angle. Driving currents $I = 0.106$ A, 0.240 A, 0.260 A, integration level I

THERMAL CHARACTERISTICS

OLEDs can generate a certain amount of heat. Despite the fact that no active cooling is required, the panels should not be covered in order to avoid heat accumulation.

The OLED temperature during operation depends on ambient conditions and driving current. Indicative values for internal (organics) temperature of the device can be measured at the glass surface at the center of the device with a thermocouple attached.

Typical temperature for the Brite 2 FL300 nw N w/o Rset Level I is 40 °C with the following set-up:

- $I = I_{\text{in rated}} = 0.260 \text{ A}$
- $T_{\text{ambient}} = RT = 25 \text{ °C}$
- vertical orientation
- climate chamber, no active convection.

Lifetime

Luminous flux reduces with lifetime of the OLED. The luminous flux of the Brite 2 FL300 decreases to approximately 70% after 10,000 hours at rated current.

Brite 2 FL300 nw

Specification item	Value	Luminous flux	Condition
OLED Panel Lifetime L70B50	10,000 hours	250lm	@ $I_{\text{in rated}} = 0.260 \text{ A}$, $T_{\text{organic}} = 40 \text{ °C}$
OLED Panel Lifetime L70B50	50,000 hours	100lm	@ 0.106 A , $T_{\text{organic}} = 30 \text{ °C}$

Voltage increases over lifetime of the OLED; color and homogeneity of the panel may also change.

Storage lifetime

Under the recommended storage conditions the shelf life of the OLED is 2 years

General handling recommendations and care

Cleaning

Please avoid scratching the front side with any hard or sharp objects. OLEDs can be cleaned with any soft textile. If required use a damp cloth but avoid extensive moisture.

Use of a compressed air spray to remove regular dust from the individual panels is advised for everyday cleaning. Should fingerprints or more persistent contamination occur, isopropanol applied to a lint-free cloth can be used to gently clean the surface of the OLED. Clean using circular movements beginning at the center of the OLED and moving outwards towards the edges. Contact with water is to be avoided.

Storage and operating

Please note that the recommended storage temperature is 15 °C to 25 °C. The recommended relative storage humidity is 65% or lower. Avoid exposing OLEDs to UV light.

Safety

Please be careful when handling OLEDs. The edges of the OLED panels may be sharp and can chip or break.

In the unlikely event that an OLED fails, the temperature may rise locally to high levels. To avoid this the OLED should be turned off immediately.

Disposal

OLEDs should be disposed of according to local legislation
